

# Task 1 – QA Report

## Application Tested

Conduit / RealWorld Demo Application

## Testing Scope

The application was tested using the public demo environment. Core user flows including user registration, login, article creation, article interaction, and navigation were manually tested to identify functional, UI/UX, validation, and security-related issues.

## Bug Report Table

| # | Title / Summary                                    | Steps to Reproduce                                                                  | Expected vs Actual                                                                                                                                                    | Severity | Suspected Cause                                                     |
|---|----------------------------------------------------|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|---------------------------------------------------------------------|
| 1 | Low text contrast reduces readability              | Open homepage and view article feed section                                         | <b>Expected:</b> Text should be clearly readable with proper contrast. <b>Actual:</b> Light gray text blends into white background, making content difficult to read. | Medium   | Poor UI color palette and insufficient accessibility contrast ratio |
| 2 | Weak passwords accepted during signup              | Register using weak passwords such as "12345" or "abc"                              | <b>Expected:</b> Application should enforce strong password rules and show validation errors. <b>Actual:</b> Weak passwords are accepted without warnings.            | High     | Missing frontend and backend password validation                    |
| 3 | Invalid email formats accepted during registration | Enter malformed email values such as "abc", "hello@", or "test@gmail" during signup | <b>Expected:</b> Invalid email formats should be rejected. <b>Actual:</b> System accepts malformed email addresses.                                                   | High     | Missing email format validation and regex checks                    |
| 4 | Unwanted black border                              | Click or focus interactive                                                          | <b>Expected:</b> Only selected input/button should receive                                                                                                            | Low      | Incorrect CSS outline/focus                                         |

| # | Title / Summary                                                | Steps to Reproduce                             | Expected vs Actual                                                                                                                                                                                                  | Severity | Suspected Cause                                              |
|---|----------------------------------------------------------------|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|--------------------------------------------------------------|
|   | appears around container on interaction                        | elements inside the article container          | subtle focus styling.<br><b>Actual:</b> Entire container receives thick black border causing poor user experience.                                                                                                  |          | styling applied to parent container                          |
| 5 | Overall UI appearance feels visually inconsistent and outdated | Navigate through homepage and article sections | <b>Expected:</b> Consistent modern UI with proper spacing, colors, and visual hierarchy. <b>Actual:</b> Muted colors, inconsistent styling, and weak visual structure reduce overall usability and user engagement. | Medium   | Lack of cohesive UI/UX design system and styling consistency |

---

## Root Cause Analysis

### Weak Password Validation Issue

The application currently allows users to create accounts using extremely weak passwords without any restrictions or warnings. During testing, passwords such as "12345" and "abc" were successfully accepted by the registration system. This creates a major security risk because weak passwords are easy to guess and vulnerable to brute-force attacks.

The issue appears to be caused by missing validation logic on both the frontend and backend systems. The frontend does not provide password strength feedback or enforce minimum password requirements before submission. Additionally, the backend accepts the request without verifying password complexity, which means users can bypass any future client-side checks as well.

To fix this issue, the application should implement password validation rules such as minimum character length, uppercase letters, numeric values, and special characters. Password strength indicators can also improve user awareness during signup. Most importantly, validation should be enforced on both frontend and backend levels to ensure security and prevent bypassing client-side validation.

---

## **Conclusion**

The application successfully supports basic article posting and navigation workflows; however, several usability, validation, accessibility, and security issues were identified during testing. The most critical findings are related to weak input validation and poor UI readability, both of which could negatively affect production-level user experience and security.
